

Analyze DI Pro

FLOATING LICENSE

GRAS-01552

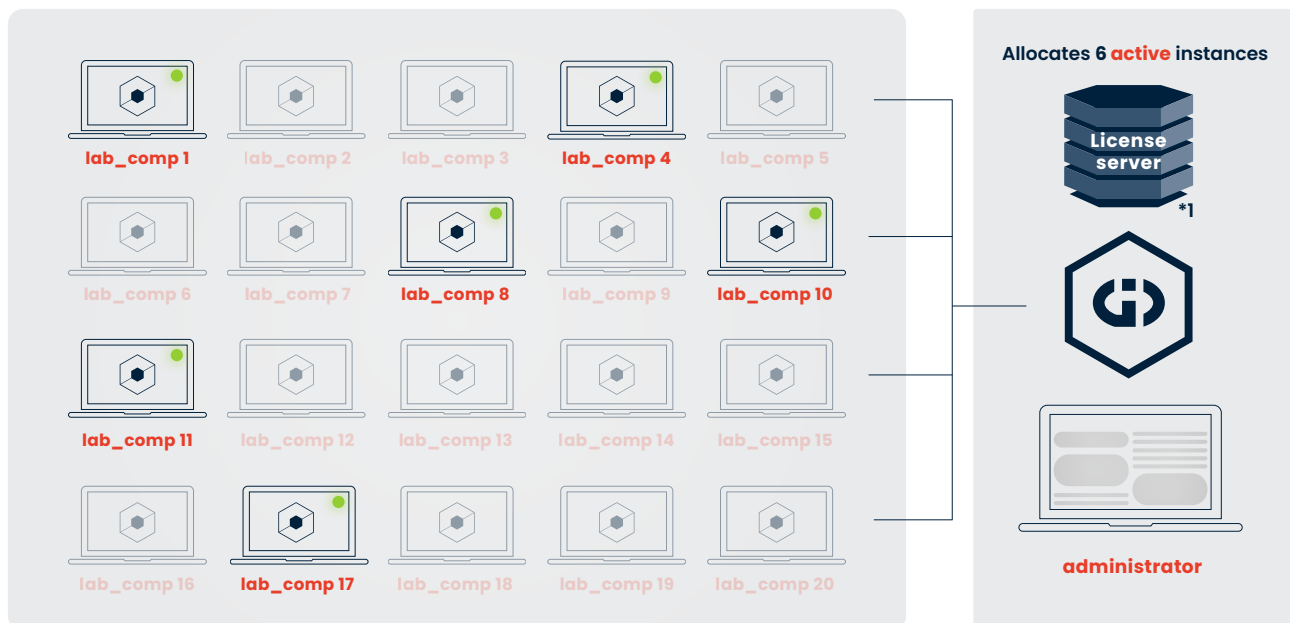

A license that is shared among users based on concurrent usage. One administrator can manage and control all installations through a locally installed license server.

Non-Personal license	Floating license	Personal license
Non-personal (shareable)	Non-personal (shareable) (several concurrent users per license)	Personal (non-shareable)
Installable on X machines per license	Licensed to X concurrent instances	Installable on Two machines per license

CASE EXAMPLE:

A police force with 20 users but never more than 6 at one time. A license server is included in the delivery, and is installed locally. The license server allocates and keeps track of concurrent machines. This setup lets multiple users take advantage of the advanced features and capabilities of DI Pro but from a centrally administered and shared resource.

To make administration easy, one person is the licenser and administrator for all of the users thru the license server. This set-up is designed to work in a virtualized environment.

*1 The license server needs to be accessible over the network by the instances.
